Climate change and heat wave-related pathologies in Senegal: a public problem?

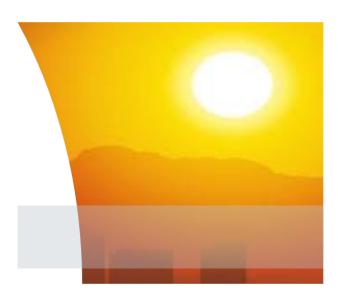

Context (1/3)

Senegal is one of the African countries most vulnerable to the effects of CC

- The entire eastern and north strip is threatened
 - □ Erosion: limits the possibility of building health facilities in certain localities (PDCS, 2019-2023) and causes displacement.
 - ☐ Flooding: stagnant rainwater promotes diseases
 - ☐ High temperatures: up to 42°C cause malnutrition and mortality MIN

Context (2/3)

- ☐Philanthropic causes
 - ☐Burnt forests
 - □ Deforestation
 - ☐ Use of firewood

Heat waves in the northern region

Context (3/3)

Emerging and re-emerging diseases

- ☐ Increased maternal and infant mortality (Basu, 2009; Manyuchi et al., 2022; Samuels et al., 2022)
- ☐ Increase in malaria morbidity, acute respiratory infections and chronic diseases (Sy et al., 2022; Fall et al., 2022).

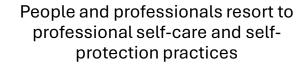

Issues (1/2)

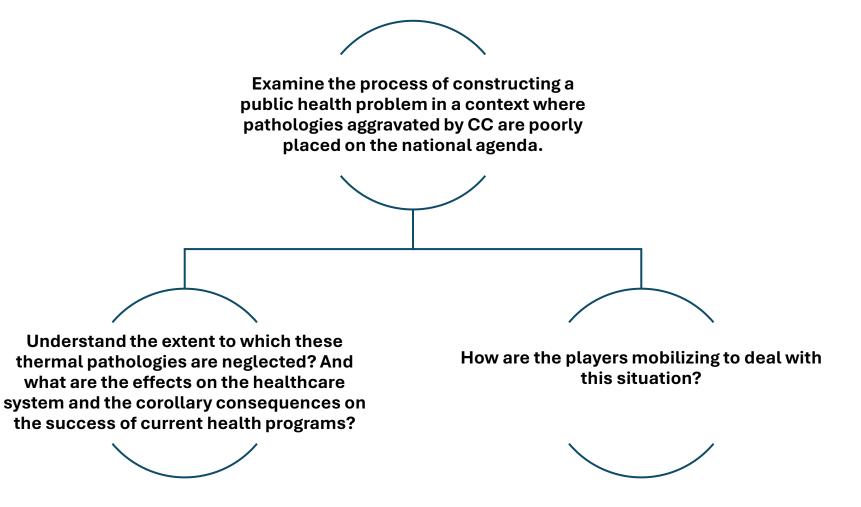

These pathologies, aggravated by extreme temperatures, are perceived by health system stakeholders as health problems with little institutionalization.

Beyond the unfavourable environmental factor, these human behaviours obstruct the success of existing health programs.

Issues (2/2)

Conceptuel framework

☐For a situation to become a public problem, it must......

☐...be sufficiently publicized

☐... be emergent

☐... be explicitly formulated

 \square ... be implemented in a way that is antinomic to existing policies.

Cadre méthodologique

Field Workers

- three medical districts selected in Matam region :Kanel, Matam and Ranérou
- 7 months immersion (November 2022 to July 2023)

Sampling

- Keys Informantes: health workers, community health workers, prospective study service agents (DP, CSE), municipal agents, environmental experts,
- Most impacted households: FAR, Seniors, Chronically ill

Tools

- Interview guide: key informants and impacted households ≥ 62
- Focus group guide: community actors n ≥ 6: N= 165
- Participatory
 observation: households,
 health facilities

Publicization

The process of publicization produces a multitude of investments and mobilizations from actors who sometimes have only a very indirect link with the problem in question.

□In Senegal,

Dependence on external funding,

☐Bias of strategic groups

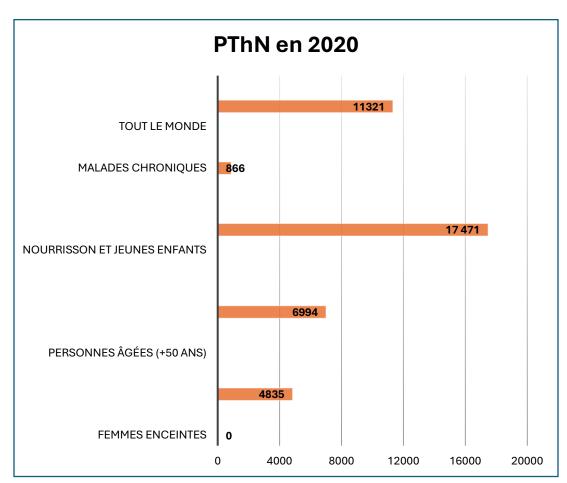

☐ Inaudible local voices

Emergence

Formulation

Health Workers

"The average consultation time per person is considerably reduced because of the heat. Normally, the consultation lasts about 30 minutes or more for new contacts, but during the hot weather it goes from 30 minutes to 15 minutes, or even less. Caregivers also suffer a lot from the effects of the heat! (KII, doctor).

Populations

"I started bleeding when I was making lunch. [...] This is due to the high heat. Unfortunately I had an abortion! The midwife was unable to do anything. It is common to see cases of abortion. The majority of women have at least one abortion. We haven't found a miracle solution yet! (Focus group, parturients).

Form of mobilisation

Health System

- Professionnal mobility
- Strikes to demand better conditions

Populations

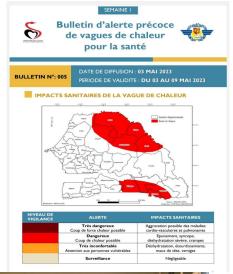

- Therapeutic mobility
- Under use health services
- Non-compliance with the AME

Mitigation strategies

Health System

Populations

CONCLUSION

- Weak formulation of ThPN as a public health problem
 - Benign diseases
 - Organizational dysfunction
- Responses more preventive than curative
 - Partial information on the climate Professional service
 - Lack of mapping of areas with a high climate vulnerability index (CVI) Events related to CC versus health needs
 - Territorialization of health
